NanoProtector Petrol is a combination of ash-free substances with cleaning, dispersing and protective properties. NanoProtector Petrol reduces CO- and HC-emissions and therefore optimizes the values before exhaust gas examination.

**NanoProtector Petrol:**

- Removes deposits from carburetors, valves, ignition plugs, injection aggregates, combustion chambers and sucking tubes, and prevents from their new formation
- Protects carburetors from ice-forming and engines and tanks from corrosion
- Prevents from engine noise
- Normalizes the values of exhaust gas
- Optimizes the combustion process
- Lowers fuel consumption because of optimal combustion and cleanness

**Application:**

Add the contents to the fuel oil in an inspection interval. The effect of NanoProtector Petrol is independent of fuel quantity. It mixes of itself.

**Use in workshops:**

In case of heavy deposits add the can contents slowly through the carburetor while the engine is running. For injection engines suck it through fuel sucking tube.

\* Store frost-free and in sealed off packaging \* lightly flammable

\*Keep away from children \*Avoid contact with skin and eyes.
